FOOD AND NUTRIENT
CONSUMPTIONPATTERN

oooOooo

A National Nutrition Monitoring Bureau was set up in June 1972 by the Indian Council of Medical Research with a view to collecting information on nutritional status and dietary habits of different representative segments of the population making use of standardized procedures and techniques. The National Institute of Nutrition is the Central Reference Laboratory which is responsible not only for technical guidance and coordination of the state units, but also for analysis and interpretation of data. The aims and objectives of the Bureau have already been reported (Plan of Operation, NNMB - 1972).

Data on food consumption and nutritional status of population from the States of Andhra Pradesh, Gujarat, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Tamil Nadu, Uttar Pradesh and West Bengal, have been collected. Table-I gives the cumulative coverage of households for dietary and nutrition surveys, since inception of the Bureau, i.e. 1972. The results of the analysis of the data collected from the regional units for the previous years with respect to rural households have been already reported (NNMB - Interim Report, 1974, NNMB Reports 1975 and 1976).

This year, the report is presented in two separate sections. Section-I provides results of the analyses of the data according to States, while in Section-II

district-wise information on diet and nutrition consumption pattern across different income groups has been given. This Section is mainly intended for the use of regional units and no attempt has been made to interpret the results of district data at this stage of analysis.

COVERAGE

A total of 4,904 households have been covered from January 1976 to December 1976 for diet and nutrition survey. of these 2,854 households were from the rural areas and the remaining from urban localities of nine States (Table-2). The States of Andhra Pradesh, Gujarat, Karnataka, Kerala and Tamil Nadu have successfully achieved survey targets with respect to both rural (400 households) and urban (250 households) coverage, while the States of Madhya Pradesh, Maharashtra, Uttar Pradesh and West Bengal fell short of this target. In each State four districts, one from each of the developmental categories (NNMB Plan of Operation, 1975) have been covered. These categories are denoted by the letters A, B, C and D. Category A represents well-developed district, while category D refers to the most backward district. The categories B and C represent intermediate groups. The names of the districts are given in Table-3.

INCOME STATUS

The distribution of householdes, according to daily per capita income, showed that, a third of the households surveyed had an income less than a rupee. (Table-4). About 68% had per capita daily income below Rs.2/- . only 7% of the households surveyed had daily income of Rs.5/- or more per caput. The income distribution of households surveyed during the year was similar to that observed last year, i.e. 1976.

PATTERN OF FOOD AND NUTRIENT INTAKE

FAMILY DIETS : Tables 5 and 6 give the average intake of foodstuffs and nutrients per c.u. per day based on family diet surveys (one day weighment method).

FOODSTUFFS: (Table-5)

Cereals and Millets: Highest consumption of cereals and millets was seen in the State of Karnataka (723 g.) while the lowest was observed in Kerala (328 g.). In general, the consumption levels in all the States were similar to those obtained in the previous year, i.e. 1976, except in Kerala and Uttar Pradesh. In Kerala, the intake was less by 60 g., while in Uttar Pradesh it was less by 100 g., as compared to last year. However, the reasons for these observed differences in these two States are not clear.

PULSES: The mean intake of pulses ranged from 15 g., in Kerala to 65 g., in Uttar Pradesh. Out of the 9 States

surveyed, the intake was more than 50 g. per c.u. per day in Uttar Pradesh, Karnataka, Madhya Pradesh and west Bengal. However, in all the States, the pulse intake was below the suggested level of 75 g. The consumption level observed in this year, compared well with levels of intake seen in the previous year, except in west Bengal where a three-fold increase was noticed during the current year. This enormous increase could be explained by the fact that in Malda District of West Bengal, nearly a third of households (i.e. 15 out of 43) showed an excessive consumption of kesari dal and lentil. The increased consumption of pulses in those households was accompanied by reduction in cereals.

The pattern and consumption levels of other foodstuffs during the year did not show significant changes as compared to last year. In all the States, the consumption of all other food items were well below the suggested levels (ICNR. Balanced Diet).

NUTRIENTS

Based on family diet surveys, the average nutrient intakes in different States per c.u. per day were calculated. These have been presented in Table-6.

PHOTEIN

The average intake of protein per c.u. per day was found to be well above the recommended levels in all the States except in Kerala. The intake in Tamil Nadu was around the recommended level of 55 g. per c.u. per day

The pattern of intake of protein in all the States was found to be similar to that observed in earlier years except in west Bengal where the intake was more by 12 g. during the current year. The reason fox the above exception may be the higher levels of consumption of pulses like Kesari Dal and lentil in some of the households of Maida District as stated earlier.

CALORIES

The mean intake of calories per c.u. per day ranged from 2052 in Kerala to 3058 in Karnataka. The States of Karnataka, Andhra Pradesh, Madhya Pradesh and West Bengal met the calorie requirement of 2,400 per c.u. per day, while in the remaining States, varying degrees of deficits in calories were observed. The deficits ranged from 4% in Maharashtra to 15% in Kerala. The pattern of calorie consumption in all the States remained similar to that observed in the previous year except in Uttar Pradesh, where a reduction of about 200 calories and in Nest Bengal, where an increase of 200 calories was observed. These differences could be

explained on the basis of decreased cereal intake in Uttar Pradesh and increased intakes of cereals and pulses in west Bengal.

MINERALS

IRON

The intake of Iron ranged from 21 mg. in Kerala to 49 mg in Karnataka. Excepting Kerala all the other States showed an intake which is above the average recommended level of 25 mg per c.u. per day.

CALCIUM

In all the States, the average intake of calcium was more than 500 mg. except in west Bengal and Uttar Pradesh where the intake was around 440 mg per c.u. per day.

VITAMINS

VITAMIN A :

In all the States diets provided inadequate amounts of retinol. The lowest level of intake was observed in Kerala (156 /ug), while the highest level of 409 /ug was seen in Maharashtra.

THIAMINE & RIBOFLAVIN :

The intake levels of thiamine and riboflavin were found to be similar to those observed in the previous year. Though the diets of all the States except

Kerala and Tamil Nadu, showed adequate levels of Thiamine, the levels of riboflavin were uniformly low per c.u. per day when compared to recommended allowances for these vitamins.

PROTEIN CALORIE ADEQUACY

To determine the adequacy or otherwise of intakes of protein and calories the following procedure was adopted:

Intakes in any household wherein the values for proteins and calories fell below the mean - 2SE of the recommended allowances were considered as inadequate. All households were thus classified into different categories of protein-calorie adequacy and inadequacy.

The percentage distribution of the households according to protein-calorie adequacy is shown in Table-7.

The proportion of households having adequate intakes of both calories and protein ranged from 42% in Kerala to 83% in Karnataka. In Andhra Pradesh about 80% of the households fell under this category, while in the remaining States, households having adequate intakes of both proteins and calories varied between 46.4 to 63.6.

The percentage of households consuming diets having inadequate proteins and calories was highest

in Kerala (39.5%) and lowest in Madhya Pradesh (5.6%). Only 3.5% of households in Kerala had diets which were inadequate in protein but adequate in calories while in other States such a situation was very rarely observed. In about 50% of the households calorie inadequacy was observed in the States of Kerala, Tamil Nadu, Gujarat and Uttar Pradesh while in about 40% of the households in the States of Maharashtra, Gujarat and West Bengal the diets were inadequate in calories. In the States of Andhra Pradesh and Karnataka, the proportion of households with calorie inadequacy was about 20%. The problem of protein inadequacy was observed more in Kerala (45%) and Tamil Nadu (30%) as compared to other States.

AVERAGE NUTRIENT INTAKE OF INDIVIDUALS

PRESCHOOL CHILDREN (1-4 YEARS)

Protein and Calories: The average intake of protein ranged from 16.3 g. in Kerala to 30.7 g. in Madhya Pradesh. Excepting in Kerala and Andhra Pradesh where the intakes of protein were marginal, in all the other States the intakes were well above the recommended allowance of 18.3 g. for this age group* However, the calorie deficiency of varying degrees was observed in all the States. On the average, only 50% of Calorie requirements was met in Kerala, while in Madhya Pradesh the deficit was about 20%, while the other States falling in between.

Minerals & Vitamins (Table-8)

Intakes of IRON were low in all the States, the lowest being in Kerala. In respect of CALCIUM, the intakes were far below the recommended allowance of 450 mg. for this age group, in all the states excepting in Tamil Nadu and Karnataka where the intakes were 410 mg and 448 mg. respectively (Table-8).

The intakes of VITAMIN A were low in all the States excepting in Gujarat and West Bengal where the intakes were 552 /ug and 261 /ug respectively. However, in Kerala, Tamil Nadu and Andhra Pradesh they were found to be low. The intakes of THIAMINE met the requirement level in all the States, while the intakes of RIBOFLAVIN did not meet the recommended allowance in any of the states (Table-8).

The nutrient intakes of various other age and sex groups have been given in Tables 9 to 17. It may generally be mentioned that the diets in all the age groups with a few exceptions seem to contain adequate amounts of protein while they are deficient in calories. The protein deficiency was, however, associated with calorie inadequacy and making good of calorie deficit in the diets of these groups will automatically bridge the protein gap as well. The diets were also found to be deficient particularly in vitamin A, riboflavin and calcium in most of the States. The intakes of iron and thiamine appeared to satisfy the requirement level.

Table-1
NMB - TOTAL COVERAGE OF POPULATION
(Till the end of December, 1976)

STATE	COVERAGE OF HOUSEHOLDS FOR DIET SURVEY			Individuals covered for nutritional assessment
	Rural	Urban	Total	
Kerala	1,242	750	1,992	11,952
Tamil Nadu	345	551	1,396	8,376
Karnataka	1,341	682	2,023	12,138
Andhra Pradesh	1,398	589	1,987	11,922
Maharashtra	900	650	1,550	9,300
Gujarat	1,608	677	2,285	13,710
Madhya Pradesh	1,133	450	1,583	9,498
West Bengal	1,091	400	1,491	8,946
Uttar Pradesh	870	215	1,085	6,510
Total	10,428	4,964	15,392	92,352

Table-2

NNMB - COVERAGE DURING THE YEAR 1976

8

NUTRITIONAL STATUS

A total of 17,862 subjects were examined for the presence of nutritional deficiency signs and on whom anthropometric measurements were also taken. of these, about 3% were infants (less than one year), 13% preschool children (1-5 years), 21% school aged children (5-12 years), 20% adolescents (12-20 years) and 43% adults (above 20 years).

DEFICIENCY SIGNS

MOST commonly observed nutritional disorders were Calorie-Protein Malnutrition, Vitamin A and B-complex deficiency and deficiency of essential fatty acids (Tables 18 to 22). The signs of Calorie-Protein Malnutrition were observed more frequently in infants and preschool children, while those of vitamin deficiencies in children of school age and adolescents. Varying degrees, of dental caries were seen in the age group beyond 5 years.

Protein Calorie Malnutrition

Clinical cases of kwashiorkor and marasmus/emaciation were seen in almost all the States, except in Madhya Pradesh in the present survey. Prevalence of marasmic type of PCM was common in infants, while in preschool children both the types of PCM, i.e. kwashiorkor

and marasmus were seen. The per cent prevalence of frank cases of oedema and clinical marasmus was highest in Uttar Pradesh as compared to other States. The point prevalence of 2 or more clinical signs of PCM ranged from 0.5% in Maharashtra to 19.0% in Uttar Pradesh in the age group of 1.5 years.

Vitamin deficiencies

Signs of vitamin A and B-complex deficiencies were relatively more in preschool children as compared to other age groups. The infants were found to be free from Obvious manifestations of vitamin A and vitamin B-complex deficiency signs. However, in Madhya Pradesh the prevalence of 2.4% vitamin A deficiency and in Karnataka and Andhra Pradesh about 1.0% of B-complex deficiency was seen in infants.

The prevalence of vitamin A deficiency signs ranged from 0.7% in Kerala to 8.7% in Madhya Pradesh in pre-school age group, while in school age group the prevalence ranged from 0.8% in Maharashtra to 27.0% in Madhya Pradesh. The prevalence of B-complex deficiency signs was highest in Karnataka, while it was lowest in Maharashtra in both preschool and school age groups. (Tables 19 & 22). It may be mentioned here that in general, the prevalence of B-complex deficiency signs indicated direct relationship with the consumption of calories. In older age groups, i.e. beyond 12 years, varying degrees of vitamin deficiency signs were seen. However, the prevalence rates tended to be more in males than in females.

Nutritional anthropometry is extensively used in community nutritional surveys to assess the nutritional status of population groups. On all the individuals examined, measurements such as standing height, body weight, mid arm circumference and fat fold thickness were obtained.

Means and standard deviations of anthropometric measurements by age and sex for each State are presented in Tables 23 to 40. The distance charts for heights and weights are presented in figures. The growth curves for the States of Kerala, Gujarat, Maharashtra, West Bengal and Tamil Nadu fell below the 50th percentile of Indian Council of Medical Research values, while those of Andhra Pradesh, Karnataka and Uttar Pradesh were comparable to the 50th percentile of Indian Council of Medical Research data. However, the differences in growth pattern were minimal during the preschool age in all the States. This is, in fact, confirmed when the body weights were classified according to Gomez's classification (Table 41 & 42). The inter-state differences in growth pattern increased with advancing age.

Weight for age:

Underweight for age has been considered as one of the early objective signs of calorie-protein malnutrition. As such the weight of all the children surveyed in different States were expressed as percentage of standard weights (Indian well-to-do) and grouped into various grades of malnutrition (Gomez's classification) Table 41 and 42.

About 10% of the children had normal body weights. The proportion of children suffering from mild and moderate degrees of malnutrition was found to be similar (about 40% in each category). Severe degree of malnutrition (weight below 60% of the standard) was observed in 8.5% of the preschool children. The degree of undernutrition was similar in boys and girls. On the whole, the extent of undernutrition was of the same order in different states. The extent of undernutrition noticed during this year is quite low as compared to last year figures (NNMB - 1976), this difference is due to the fact that the American Standard of reference was used in the previous year.

Distribution of children according to the classification suggested by Seoane and Latham which

also indicates the type of malnutrition, whether it is long term chronic or short term, etc., suggested that nearly 25% of the boys surveyed were normal (i.e. weight for age, height for age and weight for height were normal). Another 28% suffered from current long duration malnutrition, while about 3% suffered from short term malnutrition. The remaining 43% were suffering from past chronic malnutrition and could be considered as nutritional dwarfs, i.e. their heights and weights were low for their age while the weight for height values were normal. (Table-43). The girls appeared to be slightly better off than the boys (Table-44) when the above classification was used to grade malnutrition.
